How to survive Black Friday using VMSS

Vladimir Stefanovic

Cloud Solution Architect | Microsoft Azure MVP | MCT Regional
Lead | Azure Trainer

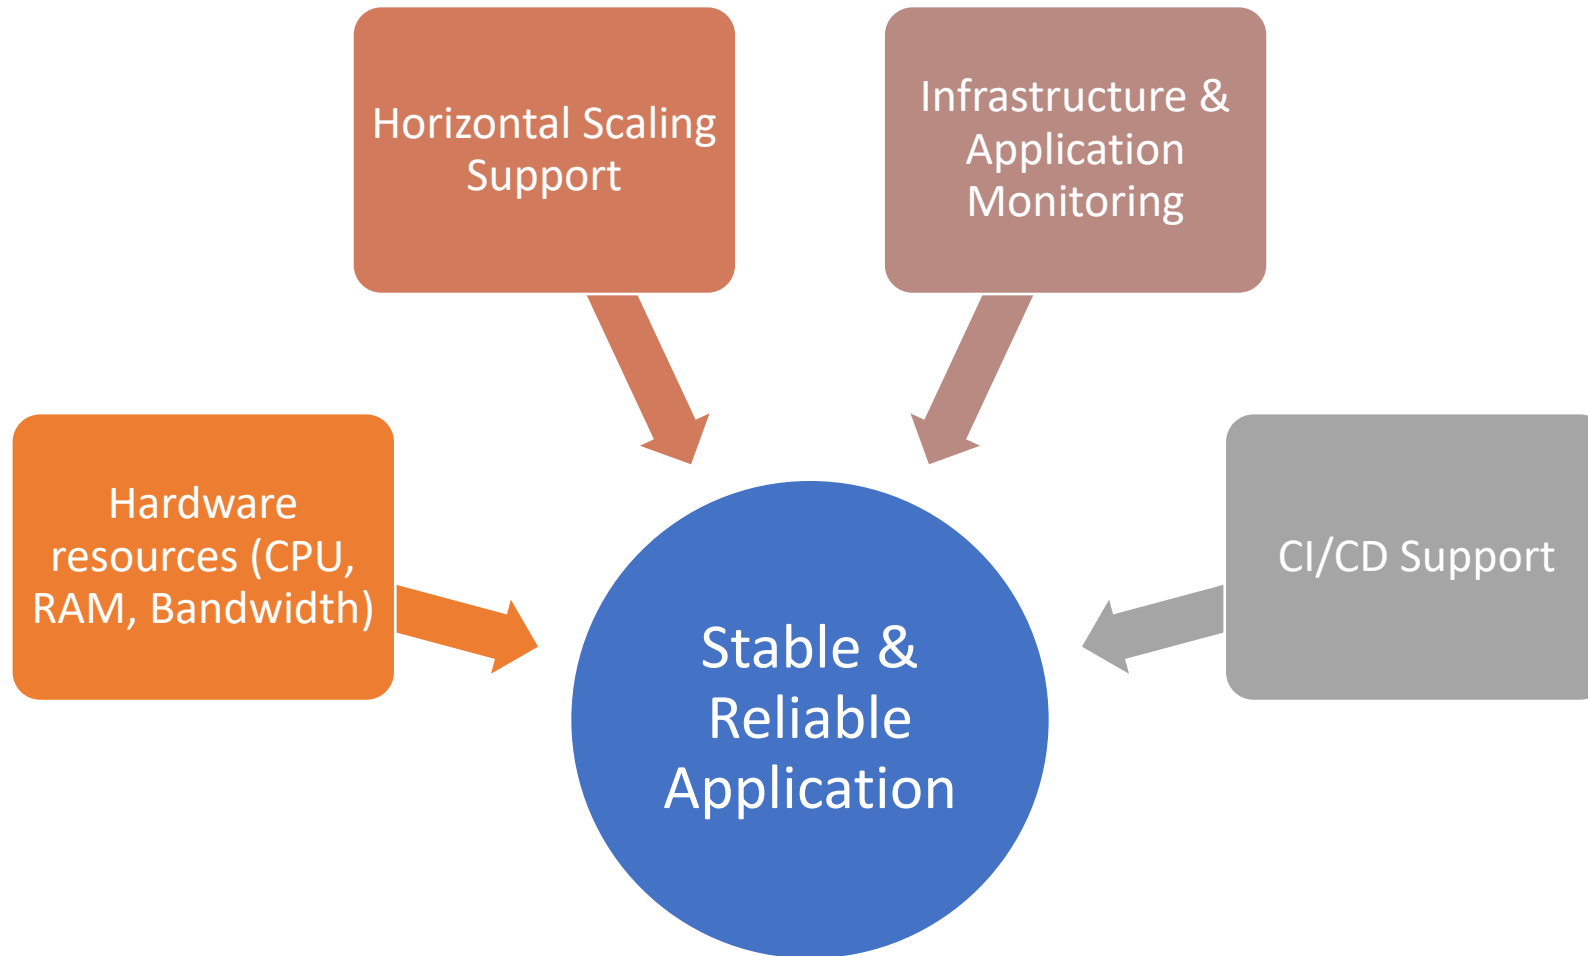

Who am I

```
vladimir@Azure:~$ az speaker show
```

```
{  
  "speakerName": "Vladimir Stefanovic",  
  "location": "Belgrade, Serbia",  
  "titles": "Microsoft Azure MVP, MCT Regional Lead",  
  "position": "Cloud Solution Architect @SuperAdmins",  
  "twitter": "@wladinho31"  
}
```

What is a stable app (from the infra perspective)?

What cloud-native services could help us?

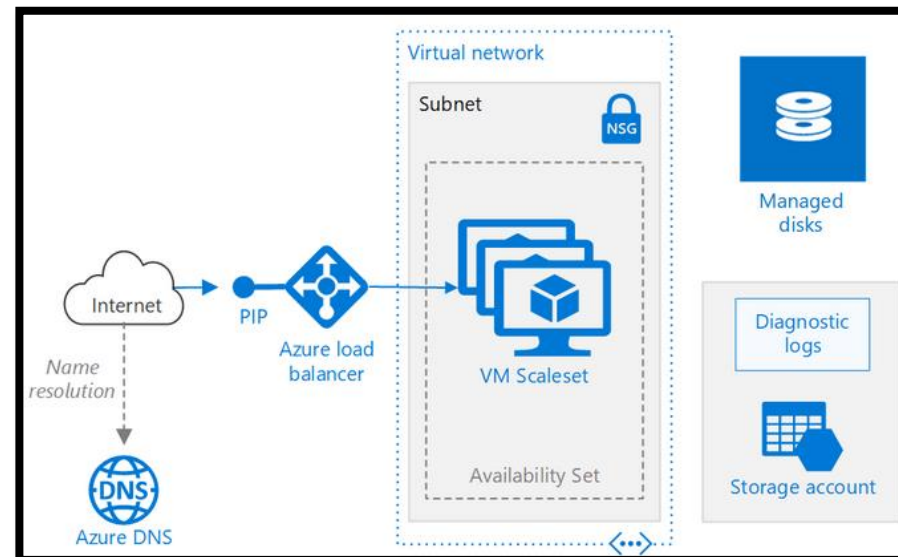

- App Service
- Azure Functions
- Containers / AKS
- Service Fabric
- ...

But ... What if we cannot use cloud-native services?

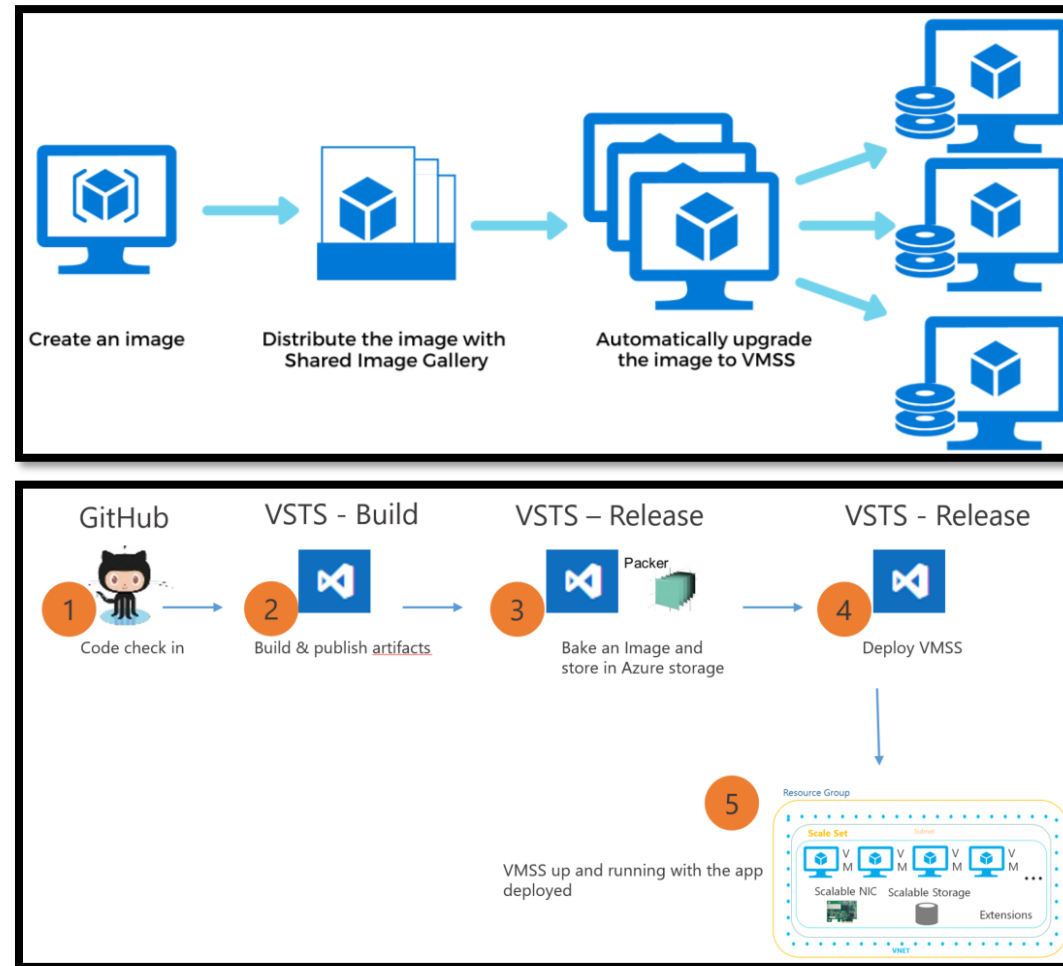

- Reasons:
 - *Old application code*
 - *There is no budget for refactoring*
 - *Custom-written services as an application dependency*
- What can we use?
 - *Azure Virtual Machines*
 - *Azure Virtual Machine Scale Set*

Use VMSS to leverage cloud-native features

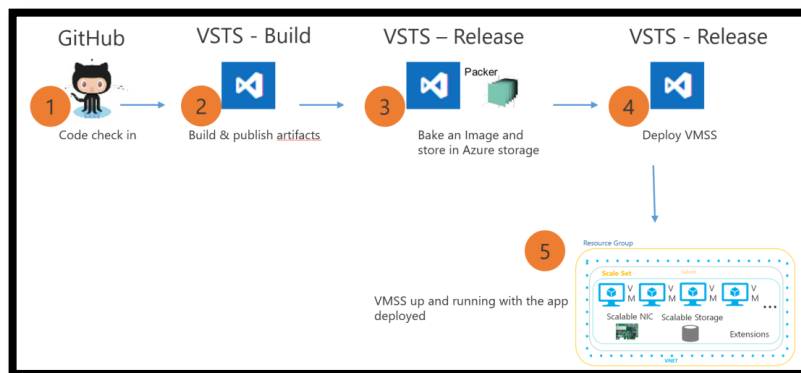

- What is the VMSS?
 - *A logical group of the (disposable) virtual machines*
 - *Instances are deployed as a unit (similar to containers)*
 - *Managed service that supports cloud-native features*

VMSS lifecycle and integrations
